Summary

Frontend developer and MCA graduate (2026) who builds fast, accessible React and TypeScript apps with clean UI and real APIs. Shipped 3 apps with 49 unit tests, all deployed with CI/CD on GitHub Pages: Reelmark, a 12-page media tracker, Git Wanted, an animated GitHub stats story, and Clackr, a typing test with a ghost race.

Projects

Reelmark | *React, TypeScript, React Router, Zustand, Tailwind CSS, TMDB API, TVmaze API* Live | Code

- Built a 12-page app to track movies, TV shows and anime across 6 watch statuses, with per-episode progress, an Up Next queue, a release calendar and personal watch stats
- Migrated the 5,000-line codebase from JavaScript to strict TypeScript, typing the TMDB and TVmaze responses and the Zustand store
- Wrote an API layer that caches requests by URL, so components asking for the same data share one network call, and maps movie and TV responses into one data model
- Cut banner image size on phones from 2–3 MB to about 100 KB with responsive srcset images; scores 94 Performance and 100 Accessibility on Lighthouse
- Built a stats dashboard with watch time, streaks and a 12-month heatmap, a downloadable "Wrapped" image, Ctrl+K search and infinite scroll with IntersectionObserver

Git Wanted | *React, TypeScript, Tailwind CSS, Motion, GitHub API* Live | Code

- Built a GTA-inspired parody that turns any GitHub profile into a 6-slide animated story and a social-style profile feed, with a downloadable Most Wanted poster
- Fetched 4 endpoints from the GitHub REST API and a contributions API in parallel, cached in sessionStorage so reopening a profile makes no new requests; handles the 60-requests-an-hour limit with a live countdown
- Wrote the stats logic (streaks, peak coding hours, top languages, favorite commit word) as pure TypeScript functions covered by 25 Vitest tests
- Built an Instagram-style story player with tap, hold and keyboard controls and reduced-motion support; the poster export library loads only on demand

Clackr | *React, TypeScript, Zustand, Tailwind CSS, Web Audio API* Live | Code

- Built a typing test with 4 modes and a ghost race that replays your best run live, a per-second speed chart and a heatmap of missed keys that generates practice tests from your weakest keys
- Wrote the typing engine and scoring (WPM, accuracy, consistency) as pure TypeScript functions covered by 24 Vitest tests, including a code mode that auto-indents new lines
- Kept typing smooth by memoizing words so only the active word re-renders, and moved the caret through refs instead of state
- Made mechanical keyboard sounds in the browser with the Web Audio API and drew the charts in plain SVG, with no chart or audio libraries

Technical Skills

Languages: JavaScript (ES6+), TypeScript, HTML5, CSS3
Frontend: React, React Hooks, React Router, Zustand, State Management, Tailwind CSS, Motion, Bootstrap, Responsive Design, Accessibility, Performance Optimization, Code Splitting
APIs: REST APIs, GraphQL, Fetch / async-await, localStorage, IntersectionObserver, Web Audio API
Testing & Tools: Vitest, Unit Testing, CI/CD, GitHub Actions, Git, GitHub, Vite, ESLint, Lighthouse, Chrome DevTools, Figma

Education

Sharda University Noida, India
Master of Computer Applications *Sep. 2024 – Aug. 2026*

GL Bajaj Institute of Technology Noida, India
Bachelor of Computer Applications *Nov. 2020 – July 2023*
